

Email Viewing Module for **viewone pro**

The Email Viewing Module allows viewing, annotation of message text, plus access to both embedded and external images and attachments. The user has the ability to view Microsoft Outlook (MSG) (in HTML & Plain Text formats) and RFC822 (EML) message files, without the need to have an email client (Outlook, Thunderbird, etc) on the machine, and the user also has the ability to save attachments.

Viewing Emails

The module allows users to view any email in its original format and layout as a single page and save the attachments embedded within the message to the local file system.

The design of ViewONE Pro and the way that available modules are layered on top, means that every viewable file type automatically benefits from the capabilities given by all modules for which a license has been purchased. This means that users have the potential to annotate and redact the content of the main message body. Additionally, if the user has purchased a license for Daeja's Print Accelerator module, then they will also be able to carry out high-speed printing of emails, compressed to fit on a single A4 page.

Viewing Attachments

There is also the facility to open and view attachments by simply clicking on the attachment icon. This then opens a tree in the thumbs index view of the document, listing all available attachments for viewing within each document.

Visual icons make clear to the user which document type they are viewing, e.g. PDF, email or an image file. Deeper viewing of attachments is possible, so the user can easily view an attachment embedded within an attachment if need be.

The real advantage of this new feature is that the behaviour is intuitive. Users can view attachments directly (subject to other modules) within ViewONE Pro without the need to load another viewing program or save to disk first.

Email viewing within ViewONE Pro with saving and viewing of attachments facility

Annotating Attachments

When used in conjunction with our ViewONE Pro Annotations Module, users can also annotate attachments found within an email.

Saving Attachments

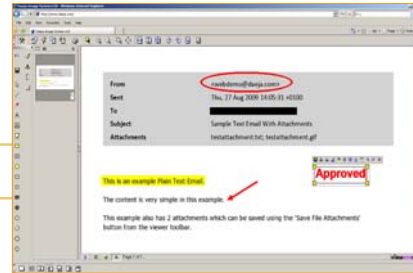

One of the customizable features of the Email Viewing Module, which is turned on by default, is the option to save attachments of an email. This option can be disabled using a HTML parameter.

Restricting External Images

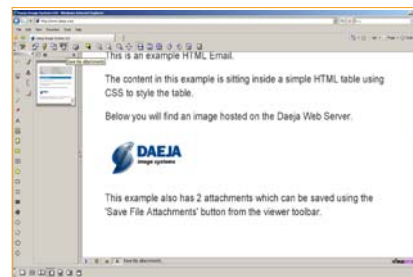

Another customizable feature of the Email Viewing Module is the ability to disable external images in emails. This can be turned on or off without the need to reload the viewer using our JavaScript parameters.

This provides users the ability to show or hide images on remote locations as done in an email client, on the fly for each email. This helps to protect online privacy by not requesting data on potentially untrusted servers. This option is turned off by default.

Please Note: A Java 2 runtime environment is required (MSJVM is not supported as it is not a Java 2 runtime environment); email messages are displayed and printed as a single page (A4/letter).
